Sound shower

The Sound Shower is a new device that permits the delivery of an audio message to a specific space temporarily.

Install it above your target and create an audio tunnel effect without disturbing people in the nearby surroundings.

Our partner Thales has entrusted Arkamys with the installation of this device in their new innovative Supervision Room.

The process requires an in-depth optimization of the broadcasted sound. Arkamys' adjustments take into account the exact configuration of the room and the characteristics of the speakers. The result is surprising.

Applications for the Sound Shower are numerous. For example, it can be used in train stations: in the event that people move too close to the railway tracks, they would hear a warning message. This device can also be used in museums, stores and so on...

With the Sound Shower, Arkamys proves its know-how and its capacity to constantly innovate new audio devices. Improving significantly the everyday life of consumers or companies is a major mission for Arkamys!
