HD3D Project

The technological advances and the increase of media (cinema, mobile, internet, TV ...) require a new way to produce digital contents. Arkamys participates to the HD3D project, supported by Cap Digital (the Paris region pole for digital content and information technologies), which brings together small and medium companies of the Technical Industries of image and sound in order to create new industrial standards.

10 small and medium companies and 5 research laboratories are involved in the partnership and put in common their know-how. The strength of this new working method is the possibility to share scattered contents through a common network.

HD3D aims to define a new platform with a new working method to optimize the rendering and the productivity. It consists in taking into account the specificity of each device (television, mobile, cinema...) in order to personalize the working method. This tool aims to reduce the cost and the time of creation of content and to improve the quality.

Arkamys is the leader of the audio work package of the project and shares its expertise with three other audio partner : CICM (Paris 8 University), CST (High Commission Technical Image and Sound) and HD3D SAS.
